- PRIORITIZE Areas: unsheltered homelessness,
 - public safety incidents,
 - community complaints,
 - areas of high danger/health risk for the homeless community
- Create New Measures: e.g. indices, coefficients, risk scores
- Things to accomplish: 1. which areas need more shelter and housing
 - 2. which areas need what kind of service
 - 3. identify populations at risk for future homelessness
- Process:
 1. Clean data
 2. Estimate homelessness density in a given area (PIT counts, LAPD/LAFD incident reports, 311 calls, Bureau of Sanitation homelessness encampments, LAHSA El Pueblo weekly census, and HMIS data)
 3. Estimate health and safety risk for homeless communities (LAPD/LAFD incident reports, heat and weather-related indices, areas susceptible to flooding, fire, or other natural emergencies, Bureau of Sanitation homelessness encampments, and HMIS data)
 4. Combine the two measurements in 2 & 3 [including count weight, risk weight and geographic boundary]
 5. Determine where existing and potential resources are located
 6. Input custom geographic and output estimated count, services, encampments, and risk factors
 7. Build a focused reporting mechanism for El Pueblo and future key areas
- Additional Phase 2 goals
 - Create a public support measure to help determine communities most likely to be receptive to new service centers/permanent supportive housing.
 - Develop a framework to track homelessness migration patterns by year, by season
